The **Clarus Collection**, a new family of high-end audio, video, digital, loudspeaker, and power cables designed for audiophiles from parent company, Gordon J. Gow Technologies, Inc. was on display in the Tributaries booth.

Developed by celebrated cable designer Jay Victor, the Clarus Collection features the **Crimson Series** (SRP: Starting at \$1,000) and **Aqua Series** (SRP: Starting at \$500). Each share the same unique performance features, the main difference being the slightly smaller wire gauges used in the Aqua cables.

Clarus audiophile-quality cables incorporate a host of patented and patent-pending technologies. Constructed from the finest metallurgy and material—CNC-machined gold-plated connectors, individually insulated interconnect and loudspeaker cable strands, new multi-gauge innovations and precision impedances, the Clarus Collection is complemented by hand-craftsmanship.

Made from oxygen-free Pure Copper by Ohno Continuous Casting (PCOCC)—the world's purest copper, and are made with precision-formulated polyethylene (PE) insulation.

Clarus digital and analog audio Interconnects, loudspeaker, and power cabling offer a patented design incorporating three distinctly different conductor types, each individually insulated; solid heavy-gauge conductors, flat conductors, and spiral-ribbon conductors (with a non-conductive core). By designing audio and digital cables with multiple strand sizes and shapes, Clarus Cables are said to dramatically improve clarity, resulting in more open and transparent sound.
